

this week we complited rating system

- create ratings table(
  - rate : 1-5
  - productId
  - userId)
- update our products table:
  - add column rating
  - write a trigger to update products.rating when there will be any insert in ratings table
- rewrite products page to show rates also
- in product page there been shon ratings also
- added in html/css starts to send user rate
- add js code to post data to '/rating' :send data to backend when star N will be clicked
  - data(
    - rating
    - productId
    - userId)
- add path to 'rating' with function sendRating
  - where it gets request values
  - inserts data to ratings table
